Gagelok Rail Screws

Progress Rail's Gagelok® screws are a unique range of fasteners for securing rails and plates to wooden ties. The self-drilling Gagelok can be used to replace track spikes and screw spikes and the specialized design prolongs tie life and minimizes tie splitting during insertion.

Gagelok® secures the rail and plate to the tie, minimizing movement to the fastening system over time and reducing damage to the rail, plate and screw itself. This results in substantially reduced system maintenance costs over time.

The GageLok E24 Torx drive allows for quick part seating in automated insertion equipment. A DIN standard wood-cutting thread and shank slot minimizes any potential tie splitting. And GageLok's shank seals the self-drilled hole, prolonging tie life by inhibiting moisture infiltration.

With all of these features, it's no wonder more than 10 million GageLok screws have been installed throughout Australia and North America. And with Progress Rail's commitment to service and expertise, you can focus on doing the job right, the first time.

BENEFITS

• Versatile fastener acts as direct replacement for cut spikes

• No need for pre-drilling holes

• Specialized shank design inhibits moisture infiltration

• Hot-dip galvanization minimizes rust formation.
