

Progress Rail has strong roots in recycling – in fact, our business was founded on it. While we have broadened our industry expertise to cover the entire rail value chain, recycling is still the heartbeat of our company. Our ability to safely recycle material while extending the life of viable components allows us to provide incremental value for your scrap metal. Our global reach provides direct access to steel mills and foundries – enabling our clients to manage their scrap as an asset.

# NON-FERROUS RECYCLING

## Non-Ferrous Recycling

Our facilities produce non-ferrous scraps products to the standards of our external customers, while maintaining Progress Rail's quality standards. Our North Alabama yards produce non-ferrous metals such as copper, brass, insulated copper wire, aluminum, stainless steel, nickel alloys, and many more products.

Our non-ferrous processing is able to market material to meet domestic and international mill, foundry, smelter and refiners standards of quality. The processing capabilities at our locations include sorting, baling and shearing of products to upgrade material and meet quality standards.

Progress Rail's strategic locations also allow for coverage and competition in multiple markets in the southeast region, including Birmingham, Huntsville, Chattanooga, Nashville and Atlanta.
