

Solar® Turbines

A Caterpillar Company

Worldwide Turbomachinery Support

FIELD SERVICE SAFETY

Vision Zero Hazard Recognition

Recognizing hazards and controlling them is Solar Turbines' approach in the drive toward zero accidents. This is a key element to doing the job right.

Highly reliable Solar® gas turbine engines are utilized in mission critical applications worldwide. And just as important as its reliability is the safety in which these complex generation, compression and pumping packages are installed and operated.

To improve employee awareness, Solar initiated a Hazard Recognition program.

Increased Awareness

Overall safety is an enterprise-wide effort at Solar. By exploring the cause of incidents, identifying energy sources in and around the package, and examining practical methods of recognizing hazards, employees are aware of potentially dangerous situations.

The Hazard Recognition program puts emphasis on several safety issues, including planning, understanding of hazards, and adequate risk assessments to educate our employees on what constitutes acceptable risk. It teaches our team that taking immediate action on an unsafe condition or near-miss is always the right thing to do.

Benefits

By fostering a culture of safety within Solar we are able to provide more value to our customers. From safe travel, to following established protocols for equipment installation, set-up and operation, we are doing everything we can to be more cost-effective, efficient and competitive, which directly benefits our customers' bottom lines.
