BCE7E Horizontal Left- and Right-Hand Discharge Unit Dimensions - inches (mm)

Horizontal Position (Right-Hand Air Discharge)

Horizontal Position (Left-Hand Air Discharge)

FOR DIMENSIONS "A" THROUGH "H", SEE CHART ON PAGE 2.
**WARNING**
Improper installation, adjustment, alteration, service or maintenance can cause property damage, personal injury or loss of life. Installation and service must be performed by a licensed professional HVAC installer or equivalent, service agency, or the gas supplier.

**IMPORTANT**
The Clean Air Act of 1990 bans the intentional venting of refrigerant (CFCs, HCFCs and HFCs) as of July 1, 1992. Approved methods of recovery, recycling or reclaiming must be followed. Fines and/or incarceration may be levied for noncompliance.

**CAUTION**
As with any mechanical equipment, contact with sharp sheet metal edges can result in personal injury. Take care while handling this equipment and wear gloves and protective clothing.

**General Information**

The BCE7E series air handler with Omniguard™ coil is designed for installation with optional field-installed electric heat and a matching HFC-410A outdoor unit.

This instruction is intended as a general guide and does not supersede local or national codes in any way. Consult authorities having jurisdiction before installation.

**Shipping and Packing List**

Package 1 of 1 contains:

1 – Assembled air handler unit
1 – Horizontal drip shield (BCE7E-060 only)
1 – Pipe nipple (Sch 80, 3/4” I.D. x 5”)
1 – Warranty card

**NOTE:** For downflow applications, order kit number 83M57.

Check the air handler for shipping damage; if found, immediately contact the last carrier.

**Requirements**

**IMPORTANT**
This unit must be matched with an indoor coil as specified in the product specification sheets. Coils previously charged with HCFC-22 must be flushed.

In addition to conforming to manufacturer’s installation instructions and local municipal building codes, installation of air handler units (with or without optional electric heat), shall conform with the following National Fire Protection Association (NFPA) standards:

- NFPA No. 90A - Standard for Installation of Air Conditioning and Ventilation Systems
- NFPA No. 90B - Standard for Installation of Residence Type Warm Air Heating and Air Conditioning Systems

This unit is approved for installation clearance to combustible material as stated on the unit rating plate. Accessibility and service clearances must take precedence over combustible material clearances.

**Use of Air Handler During Construction**

Units may be used for heating (heat pumps) or cooling of buildings or structures under construction, if the following conditions are met to ensure proper operation.

**DO NOT USE THE UNIT FOR CONSTRUCTION HEAT UNLESS ALL OF THE FOLLOWING CRITERIA ARE MET:**

- A room thermostat must control the air handler. The use of fixed jumpers is not allowed.
- Air filter must be installed in the system and must be maintained during construction.
- Air filter must be replaced upon construction completion.
- The air handler evaporator coil, supply fan assembly and duct system must be thoroughly cleaned following final construction clean-up.
- All air handler operating conditions must be verified according to these installation instructions.

EQUIPMENT MAY EXPERIENCE PREMATURE COMPONENT FAILURE AS A RESULT OF FAILURE TO FOLLOW THE ABOVE INSTALLATION INSTRUCTIONS. FAILURE TO FOLLOW THE ABOVE INSTALLATION INSTRUCTIONS VOIDS THE MANUFACTURER’S EQUIPMENT LIMITED WARRANTY. ALLIED AIR DISCLAIMS ALL LIABILITY IN CONNECTION WITH INSTALLER’S FAILURE TO FOLLOW THE ABOVE INSTALLATION INSTRUCTIONS.
NOTWITHSTANDING THE FOREGOING, INSTALLER IS RESPONSIBLE FOR CONFIRMING THAT THE USE OF CONSTRUCTION HEAT OR COOLING IS CONSISTENT WITH THE POLICIES AND CODES OF ALL REGULATING ENTITIES. ALL SUCH POLICIES AND CODES MUST BE ADHERED TO.

Installing the Unit

These units are factory-configured for upflow and horizontal right-hand discharge installation. For downflow or horizontal left-hand discharge, certain field modifications are required.

Disassemble/Reassemble Air Handler Units

The air handler units consists of two factory-assembled sections. It may be necessary to disassemble the sections when positioning the unit for installation.

To disassemble:
1. Remove access panels.
2. Remove both blower and coil assemblies. This will lighten the cabinet for lifting.
3. Remove one screw from the left and right posts inside the unit. Remove one screw from each side on the back of the unit. Unit sections will now separate.

To reassemble:
1. Align cabinet sections together.
2. Reinstall screws.
3. Replace blower and coil assemblies.
4. Replace access panel.

Upflow Application

Use the following procedures to configure the unit for upflow operations:
1. Remove access panels.
2. Remove and discard the horizontal drip shield (-060 model, used only on horizontal applications) and the corrugated padding between the blower and coil assembly.
3. The horizontal drain pan must be removed when the coil blower is installed in the upflow position. Removing the horizontal drain pan will allow proper air flow and increased efficiency.
4. After removing the horizontal drain pan, place the unit in the desired location. Set unit so that it is level. Connect return and supply air plenums as required using sheet metal screws as illustrated in Figure 1.
5. Install units that have no return air plenum on a stand that is at least 14" from the floor to allow for proper air return. An optional upflow unit stand is listed in Table 1.

Horizontal Right-Hand Discharge Application

Use the following procedures to configure the unit for horizontal right-hand discharge operations:

NOTE: For horizontal applications, a secondary drain pan is recommended. Refer to local codes.

1. Before operating the unit, remove access panels and the horizontal drip shield (-060 model) and the corrugated padding between the blower and coil assembly. Discard the corrugated padding.
2. Install the horizontal shield on the front edge of the horizontal drain pan as illustrated in Figure 2.
3. No further adjustment is necessary. Set unit so that it is sloped 1/4" towards the drain pan end of the unit.
4. If the unit is suspended, the entire length of the cabinet must be supported. If you use a chain or strap, use a piece of angle iron or sheet metal attached to the unit (either above or below) to support the length of the cabinet. Use securing screws no longer than 1/2" to avoid damaging the coil or filter as illustrated in Figure 3. Use sheet metal screws to connect the return and supply air plenums as required.

**Figure 1. Upflow Configuration**

**Figure 2. Right-Hand Discharge Configuration**
Horizontal Right-Hand Discharge Application in High-Humidity Areas

For horizontal applications in high humidity areas, remove the downflow rail closest to the drain pan.

To remove rail:
1. Remove the screws from the rail at the back of unit and at the cabinet support rail.
2. Remove the downflow rail then replace screws.
3. Seal around the exiting drain pipe, liquid line, and suction line to prevent humid air from infiltrating into the unit.

**IMPORTANT**

When removing the coil, there is possible danger of equipment damage and personal injury. Be careful when removing the coil assembly from a unit installed in right- or left-hand applications. The coil may tip into the drain pan once it is clear of the cabinet. Support the coil when removing it.

Use the following procedures to configure the unit for horizontal left-hand discharge operations:

1. Before operating the unit, remove access panels and the horizontal drip shield (-060 model) and the corrugated padding between the blower and coil assembly. Discard the corrugated padding.
2. Pull the coil assembly from unit. Pull off the horizontal drain pan.
3. Remove the drain plugs from back drain holes on horizontal drain pan and reinstall them on front holes.

After removal of drain pan plug(s), check drain hole(s) to verify that drain opening is fully open and free of any debris. Also check to make sure that no debris has fallen into the drain pan during installation that may plug up the drain opening.

4. Rotate drain pan 180º front-to-back and install it on the opposite side of the coil.

Horizontal Left-Hand Discharge Application

**NOTE:** For horizontal applications, a secondary drain pan is recommended. Refer to local codes.

Figure 4. Left-Hand Discharge Configuration

1. Before operating the unit, remove access panels and the horizontal drip shield (-060 model) and the corrugated padding between the blower and coil assembly. Discard the corrugated padding.
2. Pull the coil assembly from unit. Pull off the horizontal drain pan.
3. Remove the drain plugs from back drain holes on horizontal drain pan and reinstall them on front holes.

</tr>
</tbody>
</table>

**IMPORTANT**

After removal of drain pan plug(s), check drain hole(s) to verify that drain opening is fully open and free of any debris. Also check to make sure that no debris has fallen into the drain pan during installation that may plug up the drain opening.

4. Rotate drain pan 180º front-to-back and install it on the opposite side of the coil.

Figure 5. Field Modification for Left-Hand Discharge

--

Page 6 of 18  Issue 1941  507838-02
5. Remove screws from top cap. Remove drip shield screw located in the center of the back coil end seal as illustrated in Detail A in Figure 5.

7. Remove plastic plug from left hole on coil front end seal and reinstall plug in back hole. Reinstall drip shield screw in front coil end seal. Drip shield should drain downward into horizontal drain pan inside coil.

8. Rotate top cap 180° front-to-back and align with unused screw holes. Holes must align with front and back coil end plates (see Detail B in Figure 5). The top cap has a 45° bend on one side and a 90° bend on the other. The 90° bend must be on the same side as the horizontal drain pan as illustrated in Detail A in Figure 5.

**NOTE:** Be very careful when reinstalling the screws into the coil end plate engaging holes. Misaligned screws may damage the coil.

9. From the upflow position, flip cabinet 90° to the left and set into place. Replace blower assembly. Secure coil in place by bending down the tab on the cabinet support rail as illustrated.

**NOTE:** Seal around the exiting drain pipe, liquid and suction lines to prevent infiltration of humid air.

10. Install the splash guard (-060 model only) on the front edge of the horizontal drain pan as illustrated in Figure 4.

**NOTE:** For horizontal applications in high humidity areas, remove the downflow rail closest to the drain pan. To remove rail, remove screw from rail at back of unit and at cabinet support rail. Remove downflow rail then replace screws. Also, seal around the exiting drain pipe, liquid and suction lines to prevent infiltration of humid air.

11. Knock out drain seal plate from access door. Secure plate to cabinet front flange with screw provided.

12. Flip access door and replace it on the unit.

13. Set unit so that it is sloped 1/4” toward the drain pan end of the unit. Connect return and supply air plenums as required using sheet metal screws.

14. If suspending the unit, it must be supported along the entire length of the cabinet. If using chain or strap, use a piece of angle iron or sheet metal attached to the unit (either above or below) so that the full length of the cabinet is supported. Use securing screws no longer than 1/2” to avoid damage to coil or filter, as illustrated in Figure 3. Connect return and supply air plenums as required using sheet metal screws.

**Downflow Application**

**NOTE:** If downflow application is required, separately order kit number 83M57 and install per kit’s instructions. Also use metal or class I supply and return air plenums. Use the installation instruction provided with the downflow kit.

---

**Brazing Connections**

**IMPORTANT**

If electric heat section with circuit breakers (AEHK) is installed in a BCE7E unit in a downflow application, the circuit breakers must be rotated 180° to the UP position. See AEHK installation instructions for more details.

---

**IMPORTANT**

To prevent the build-up of high levels of nitrogen when purging, it must be done in a well-ventilated area. Purge low-pressure nitrogen (1 to 2 psig) through the refrigerant piping during brazing. This will help to prevent oxidation and the introduction of moisture into the system.

All coils are equipped with a factory-installed, internally mounted check/expansion valve.

Table 2. Refrigerant Line Sizes

---

**WARNING**

To prevent the build-up of high levels of nitrogen when purging, it must be done in a well-ventilated area. Purge low-pressure nitrogen (1 to 2 psig, 6.9 to 13.8 kPa) through the refrigerant piping during brazing. This will help to prevent oxidation and the introduction of moisture into the system.

**NOTE:** BCE7E series air handlers use nitrogen or dry air as a holding charge. If there is no pressure when the rubber plugs are removed, check the coil for leaks before installing. After installation, pull a vacuum on the line set and coil before releasing the unit charge into the system.

**NOTE:** See outdoor unit instructions on how to flow nitrogen through line sets.
5. With the wet rag in place, position a field provided elbow fitting to the air handler’s suction line and line set. Start nitrogen flow before brazing.

6. After the procedure is completed then remove the wet rag.

7. Place wet rag against piping plate and around the liquid line connection. Position liquid line elbow to air handler’s suction line and to line set. Start nitrogen flow and begin brazing both connections and after procedure is completed then remove both wet rags.

8. Refer to instructions provided with outdoor unit for leak testing, evacuating and charging procedures.

9. Install access panel.

---

**Installing the Condensate Drain**

**Main Drain**

Connect the main drain and route downward to drain line or sump. Do not connect drain to a closed waste system. See Figure 7 for typical drain trap configuration.

**Overflow Drain**

It is recommended that the overflow drain is connected to an overflow drain line for all units. If overflow drain is not connected, it must be plugged with provided cap.

---

**Figure 6. Brazing Connections**

1. Remove access panel.
2. Remove the refrigerant line caps from the refrigerant lines.
3. Use a wet rag to protect TXV sensing bulb (or remove it) when brazing suction line connections.
4. Place a wet rag against piping plate and around the suction line connection. The wet rag must be in place to guard against damage to the paint.

---

**Figure 7. Typical Main and Overflow Drain**
To replace filter:
1. Loosen the thumbscrews holding the filter panel in place. Remove the dirty filter.
2. Insert new filter and replace panel.

Table 3. Filter Dimensions

Sealing the Unit

**WARNING**

There must be an airtight seal between the bottom of the air handler and the return air plenum. Use fiberglass sealing strips, caulking, or equivalent sealing method between the plenum and the air handler cabinet to ensure a tight seal. Return air must not be drawn from a room where this air handler or any gas-fueled appliance (i.e., water heater), or carbon monoxide-producing device (i.e., wood fireplace) is installed.

Seal the unit so that warm air is not allowed into the cabinet. Warm air introduces moisture, which results in water blow-off problems. This is especially important when the unit is installed in an unconditioned area.

Make sure the liquid line and suction line entry points are sealed with either the provided flexible elastomeric thermal insulation, or field provided material (e.g. Armallex, Permagum or equivalent). Any of the previously mentioned materials may be used to seal around the main and auxiliary drains, and around open areas of electrical inlets.

Measuring Static Pressure

1. Measure tap locations as shown in Figure 9.

![Figure 9. Static Pressure Test](image)

2. Punch a 1/4" (6mm) diameter hole in supply and return air plenums. Insert manometer hose flush with inside edge of hole or insulation. Seal around the hose with Permagum. Connect the zero end of the manometer to the discharge (supply) side of the system. On ducted...
systems, connect the other end of manometer to the return duct as above. For systems with non-ducted returns, leave the other end of the manometer open to the atmosphere.

3. With only the blower motor running and the evaporator coil dry, observe the manometer reading. Adjust blower motor speed to deliver the air desired according to the job requirements.

4. For best air performance external static pressure drop must not exceed 0.5” W.C. (1.2 kPa). Refer to blower data tables for CFM and external static.

5. Seal around the hole when the check is complete.

### Adjusting Blower Speed

**Motor Speed Taps**

**NOTE:** Motor is programmed for a 45-second delayed OFF on all speed taps except TAP #1 (continuous fan speed).

Table 4 lists the recommended factory blower speed tap selections for BCE7E series units.

<table>
<thead>
<tr>
<th>Tap</th>
<th>Operation</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Continuous or low-speed fan (for two-speed heat pumps or AC units)</td>
<td>Continuous fan speed is energized (24V input to G) when either G or Y1 has a 24V signal (24V input from Y1 passes through the room thermostat’s Fan Automatic contacts to the G terminal).</td>
</tr>
<tr>
<td>2</td>
<td>Low-speed operation on high-static system</td>
<td>CFM set at 1/2 ton less than nominal of unit (e.g. 3-ton set at 1000 CFM).</td>
</tr>
<tr>
<td>3</td>
<td>Cooling speed setting</td>
<td>CFM set at 400 cfm per nominal ton at ARI minimum static allowed, as follows: 1.5 to 2.0 ton - 0.10 2.5 to 3.5 ton - 0.15 4 to 5 ton - 0.20</td>
</tr>
<tr>
<td>4</td>
<td>Heat pump with electric heat</td>
<td>CFM set at 400 cfm per nominal ton at .4 static. Energized when electric heat element has a call for heat.</td>
</tr>
<tr>
<td>5</td>
<td>High-static applications</td>
<td>CFM set at 400 cfm per nominal ton at .8 static.</td>
</tr>
</tbody>
</table>

### Table 4. Recommended Blower Speed Tap Selection

These settings are for nominal tonnage match-ups with the BCE7E units. When matched with other sizes, it is recommended that the CFM be adjusted to approximately 400 CFM per ton.

To change blower motor speed tap remove the speed tap from Y2 on the terminal strip and insert the desired speed tap. Use the Blower Data tables for the desired CFM setting.

**IMPORTANT**

The high-efficiency programmable motor features programmed electronic braking. The integral control brakes the motor near the end of the supply blower operation, allowing the motor to maintain a more controlled ramping shut-down.

Making Electrical Connections

**WARNING**
Run 24V Class II wiring only through specified low voltage opening. Run line voltage wiring only through specified high voltage opening. Do not combine voltage in one opening.

**CAUTION**
USE COPPER CONDUCTORS ONLY.

This unit is provided with knock-outs for conduit. Refer to Figure 11 for unit wiring diagram, which includes all field wiring. Separate openings have been provided for 24V low voltage and line voltage. Refer to the dimension illustration on Page 2 or Page 3 for specific location.

Select the proper supply circuit conductors in accordance with tables 310-16 and 310-17 in the National Electric Code, ANSI/NFPA No. 70 or tables 1 through 4 in the Canadian Electric Code, Part I, CSA Standard C22.1.

The motor speed is set by the speed tap connection to the low voltage terminal strip in the control section. The speed can be increased by swapping wires as shown in Figure 11.

---

**Wiring Connections**

1. Install line voltage power supply to unit from a properly installed circuit breaker.
2. Ground unit at unit disconnect switch or to an earth ground.

    **NOTE:** Connect conduit to the unit using a proper conduit fitting. Units are approved for use only with copper conductors. A complete unit wiring diagram is located on the back side of the unit’s access panel.

3. Install low voltage wiring from outdoor to indoor unit and from thermostat to indoor unit.

    **NOTE:** For proper voltages, select thermostat wire gauge per the following chart:

<table>
<thead>
<tr>
<th>Wire Run Length</th>
<th>AWG#</th>
<th>Insulation / Core Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 100’ (30m)</td>
<td>18</td>
<td>Color coded, temperature rating 95°F (35°C) minimum, solid core</td>
</tr>
<tr>
<td>More than 100’ (30m)</td>
<td>16</td>
<td></td>
</tr>
</tbody>
</table>

Table 6. Run Length (Class II Rated Wiring)

Install room thermostat (ordered separately) on an inside wall approximately in the center of the conditioned area and 5 feet (1.5m) from the floor. It should not be installed on an outside wall or where it can be affected by sunlight or drafts.

**NOTE** - 24 VAC, Class II

circuit connections are made in the control panel.

**NOTE** - Units are approved for use only with copper conductors.

Ground unit at disconnect switch or to an earth ground.

Homeowner Maintenance

**IMPORTANT**

Do not operate system without a filter. A filter is required to protect the coil, blower, and internal parts from excessive dirt and dust. The filter is placed in the return duct by the installer.

- Inspect air filters at least once a month and replace or clean as required. Dirty filters are the most common cause of inadequate heating or cooling performance.
- Replace disposable filters. Cleanable filters can be cleaned by soaking in mild detergent and rinsing with cold water.
- Install new/clean filters with the arrows on the side pointing in the direction of air flow. Do not replace a cleanable (high velocity) filter with a disposable (low velocity) filter unless return air system is properly sized for it.
- If water should start coming from the secondary drain line, a problem exists which should be investigated and corrected. Contact a qualified service technician.

Professional Maintenance

**NOTICE**

Failure to follow instructions will cause damage to the unit.

This unit is equipped with an aluminum Omniguard™ coil. Aluminum coils may be damaged by exposure to solutions with a pH below 5 or above 9. The aluminum coil should be cleaned using potable water at a moderate pressure (less than 50psi). If the coil cannot be cleaned using water alone, it is recommended to use a coil cleaner with a pH in the range of 5 to 9. The coil must be rinsed thoroughly after cleaning.

In coastal areas, the coil should be cleaned with potable water several times per year to avoid corrosive buildup (salt).

Repairing or Replacing Cabinet Insulation

**IMPORTANT**

DAMAGED INSULATION MUST BE REPAIRED OR REPLACED before the unit is put back into operation. Insulation loses its insulating value when wet, damaged, separated or torn.

Matte- or foil-faced insulation is installed in indoor equipment to provide a barrier between outside air conditions (surrounding ambient temperature and humidity) and the varying conditions inside the unit. If the insulation barrier is damaged (wet, ripped, torn or separated from the cabinet walls), the surrounding ambient air will affect the inside surface temperature of the cabinet. The temperature/humidity difference between the inside and outside of the cabinet can cause condensation on the inside or outside of the cabinet which leads to sheet metal corrosion and subsequently, component failure.

**Repairing Damaged Insulation**

Areas of condensation on the cabinet surface are an indication that the insulation is in need of repair.

If the insulation in need of repair is otherwise in good condition, the insulation should be cut in an X pattern, peeled open, glued with an appropriate all-purpose glue and placed back against the cabinet surface, being careful to not overly compress the insulation so the insulation can retain its original thickness. If such repair is not possible, replace the insulation. If using foil-faced insulation, any cut, tear, or separations in the insulation surface must be taped with a similar foil-faced tape.

**Electric Shock Hazard.**

Can cause injury or death.

Foil-faced insulation has conductive characteristics similar to metal. Be sure there are no electrical connections within 1/2" of the insulation. If the foil-faced insulation comes in contact with electrical voltage, the foil could provide a path for current to pass through to the outer metal cabinet. While the current produced may not be enough to trip existing electrical safety devices (e.g., fuses or circuit breakers), the current can be enough to cause an electrical shock hazard that could cause personal injury or death.

**IMPORTANT**

1. CUT INSULATION IN X PATTERN
2. APPLY GLUE
3. PRESS GLUED TABS AGAINST CABINET

**Figure 12. Repairing Insulation**
Check-out Procedures

**IMPORTANT**
During installation, service or maintenance, make sure that copper tubing does not rub against metal edges or other copper tubing. Care should also be taken to ensure that tubing does not become kinked. Use wire ties to secure tubing to prevent movement.

Do not secure electrical wires to tubing that carries hot refrigerant gas. Heat from the tubing may melt the wiring insulation, causing a short circuit.

**NOTE:** Refer to outdoor unit installation instructions for system start-up instructions and refrigerant charging instructions.

**Pre-Start-Up Checks**
- Is the air handler properly and securely installed?
- If horizontally configured, is the unit sloped up to 1/4 inch toward drain lines?
- Will the unit be accessible for servicing?
- Has an auxiliary pan been provided under the unit with separate drain for units installed above a finished ceiling or in any installation where condensate overflow could cause damage?
- Have ALL unused drain pan ports been properly plugged?
- Has the condensate line been properly sized, run, trapped, pitched, and tested?
- Is the duct system correctly sized, run, sealed, and insulated?
- Have all cabinet openings and wiring been sealed?
- Is the indoor coil factory-installed TXV properly sized for the outdoor unit being used?
- Have all unused parts and packaging been disposed of?
- Is the filter clean, in place, and of adequate size?
- Is the wiring neat, correct, and in accordance with the wiring diagram?
- Is the unit properly grounded and protected (fused)?
- Is the thermostat correctly wired and in a good location?
- Are all access panels in place and secure?

**Check Blower Operation**
- Set thermostat to FAN ON.
- The indoor blower should come on.

**Check Cooling Operation**
- Set thermostat to force a call for cooling (approximately 5°F lower than the indoor ambient temperature).
- The outdoor unit should come on immediately and the indoor blower should start between 30 - 60 seconds later.
- Check the air flow from a register to confirm that the system is moving cooled air.
- Set the thermostat 5°F higher than the indoor temperature. The indoor blower and outdoor unit should cycle off.

**Check Electric Heat (If Used)**
- Set thermostat to call for auxiliary heat (approximately 5°F above ambient temperature). The indoor blower and auxiliary heat should come on together. Allow a minimum of 3 minutes for all sequencers to cycle on.
- Set the thermostat so that it does not call for heat. Allow up to 5 minutes for all sequencers to cycle off.
