

# CAT® DETECT WITH SURROUND CAMERAS

## A SAFER SITE IN PLAIN SIGHT

### ALL-AROUND SAFETY

Cat® Surround Cameras give the machine operator a bird's-eye view while in the cab.

This system safety features are designed to increase operator's visibility around the machine, and in turn, their productivity. Let's check them out:

1. Rugged, vibration-resistant cameras (three or four) that mount to the outside of the machine.
2. A high-definition, in-cab display that presents live images in the cab.
3. Display view options that allow the operator to focus on the camera and area of their choice.

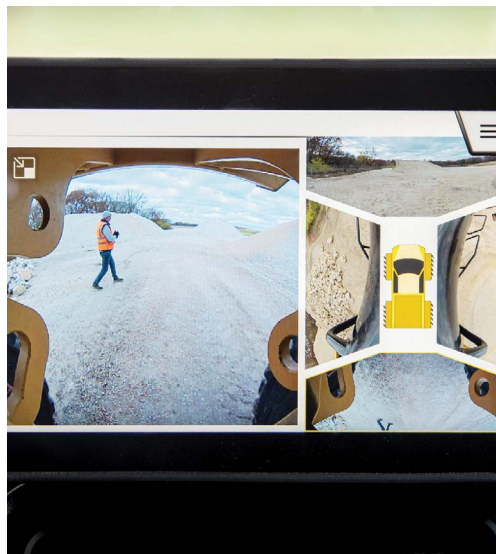

#### CAN SURROUND CAMERAS BE INSTALLED ON MY FLEET?

Adding it to your Cat equipment — and other brands — is easy. You can install it on any machine with a 12V or 24V DC system.

### HOW IT WORKS

Surround Cameras can be placed on the sides, rear, and front of the machines. Real-time transmission is sent from the cameras to the in-cab display. From there, operators have the choice to see views from all the cameras at once, or a larger, dedicated view of an area the operator wants to focus on. Its robust design allows it to withstand tough working conditions.

### THE BENEFITS OF SAFETY

The Surround Camera system promotes visibility around the machine so operators can have more trust that their coworkers are safe — and as a result, be more productive in their work. Another great benefit to Surround Cameras is the view from all cameras combined in one display view. Operators won't need to twist in their seats to see their surroundings. Help prevent accidents, reduce costs and increase productivity with Surround Cameras.
