Road Rehabilitation

Road Rehabilitation

At Kennametal, our commitment to your most demanding road rehabilitation applications is unparalleled. We have a long history of helping you achieve success and a tradition of exceeding your expectations.

We remain focused on redefining and advancing the earthworks industries through our world-class solutions — delivered by professionals who are committed to the health and profitability of your enterprise.

MISSION Kennametal delivers productivity to customers seeking peak performance in demanding environments by providing innovative custom and standard wear-resistant solutions, enabled through our advanced materials sciences, application knowledge, and commitment to a sustainable environment.

The foundation for a successful road rehabilitation operation is built on rock-steady reliability and progress. Kennametal, the world's leading tooling and services provider, proudly introduces SOLID, our solution-focused platform that yields new levels of performance and productivity. SOLID-engineered tools deliver in the most challenging conditions. For unmatched quality, value, innovation, and application expertise, make Kennametal your SOLID choice.

Safety and Environment

Kennametal's goal of 100% safe extends far beyond our global operations to reach customers at their work sites, encouraging a community that values the implementation of safety procedures.

Kennametal ensures safety compliance by thoroughly testing and inspecting products and confirming that vehicles are appropriately equipped with safety equipment. Safety training is readily available to employees and customers alike. Whether in the office or at a customer's site, our employees drive a culture of 100% safe.

THE CHALLENGE

Offer a Variety of Tool Designs
for Demanding Environments

THE RESULT

A road milling contractor in Midwestern USA was milling off an extremely hard and abrasive asphalt aggregate — consuming almost 100 teeth per hour, and causing excessive wear to tooth holders. Kennametal not only secured extra teeth for the company but also sent several tool designs to test along with a field representative for hands-on support. Kennametal's RoadRazor tool in particular outshone the others almost two to one in extremely demanding conditions.

We protect our planet with a commitment to reduce the global impact Kennametal and our customers have on the environment — establishing effective sustainability practices and policies within the mining industry.

Helping customers meet their overall goals is clearly an objective of Kennametal's sustainability program. We focus on products that provide customers with lower fuel costs, reduced packaging requirements, lower transportation costs, and improved product performance. Kennametal continues to evaluate improved packaging materials — such as biodegradable options. By helping customers address their need to become more efficient, we make ourselves more sustainable.

THE CHALLENGE Superior Tool Design

THE RESULT

An innovator in road recycling recently purchased 20 skids of Kennametal's new RoadRazor ECO™ tool RX04-01, as the majority of the company's crews demanded the tools onsite. With a better road pattern, less vibration on machine, and longer tool life, the company's equipment managers assert that RoadRazor ECO™ is a far superior tool than others in their arsenal.

METALCUTTING CAPABILITIES For more than 70 years, our operational excellence has made Kennametal a powerful global leader in the design and manufacture of engineered components, advanced materials, and cutting tools used in the most demanding environments on earth.

Turning | Threading | Grooving | Cut-Off | Indexable Milling
Solid End Milling | Holemaking | Hole Finishing | Tapping | Tooling Systems

Earth Cutting Tools — Product Highlights

With leading-edge products from Road Rehabilitation conicals to custom-fabricated cutter drums, we keep high-value equipment running longer and performing better in demanding environments.

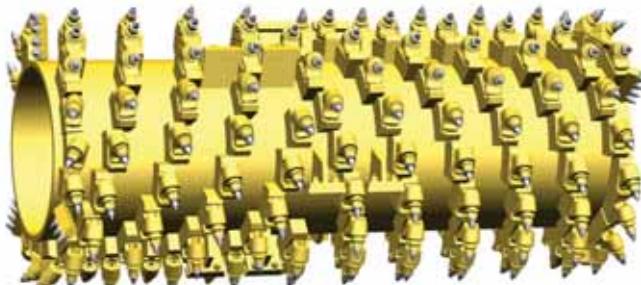

RoadRazor ECO™ Pro

- Unique body shape with maximum hardness throughout the entire head area, makes cutting easier and is less resistant to extreme wear and friction.
- Proprietary nonagon shaped washer is 20% thicker, extending the life of the tool and the holder.
- Machines absorb less abuse and can consume less fuel.

Drums and Block Systems

- Exceptional performance milling drums (standard, profile, micro, or custom design).
- Rebuild Program available.
- Specially hardened, wear-resistant, easy to install and change block systems.

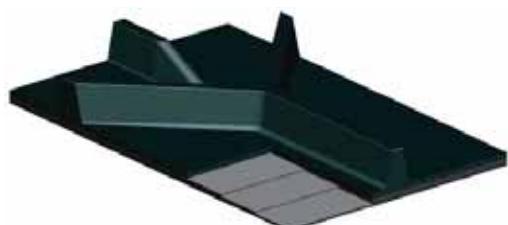

Soil Stabilization SZ Series

- Higher body hardness including collar for maximum wear resistance.
- Wide collar offers superior holder protection.
- Various tip designs available to match your specific application.
- Improved retainer for maximum retention and holder protection.

Conveyor Rollers

- Garland and flat return rollers.
- Extra long design reduces gaps between center and wing rolls, ensuring better belt tracking and maintenance.
- Lightweight, durable, and economical.

Conveyor Belts

- High abrasion resistance.
- High cleats for maximum capacity.
- Cleat and upper layer manufactured in one process step for maximum reliability.

Wear and Tooling Solutions for Your Earthworks Equipment

The Kennametal Earthworks segment serves top-tier companies across varied applications: highway construction, underground mining, surface mining, quarrying, utility construction, tunneling, recycling, forestry, agriculture, and snow removal. With our superior custom and standard cutting and wear-resistant solutions, we help our clients build and maintain best-in-class operations.

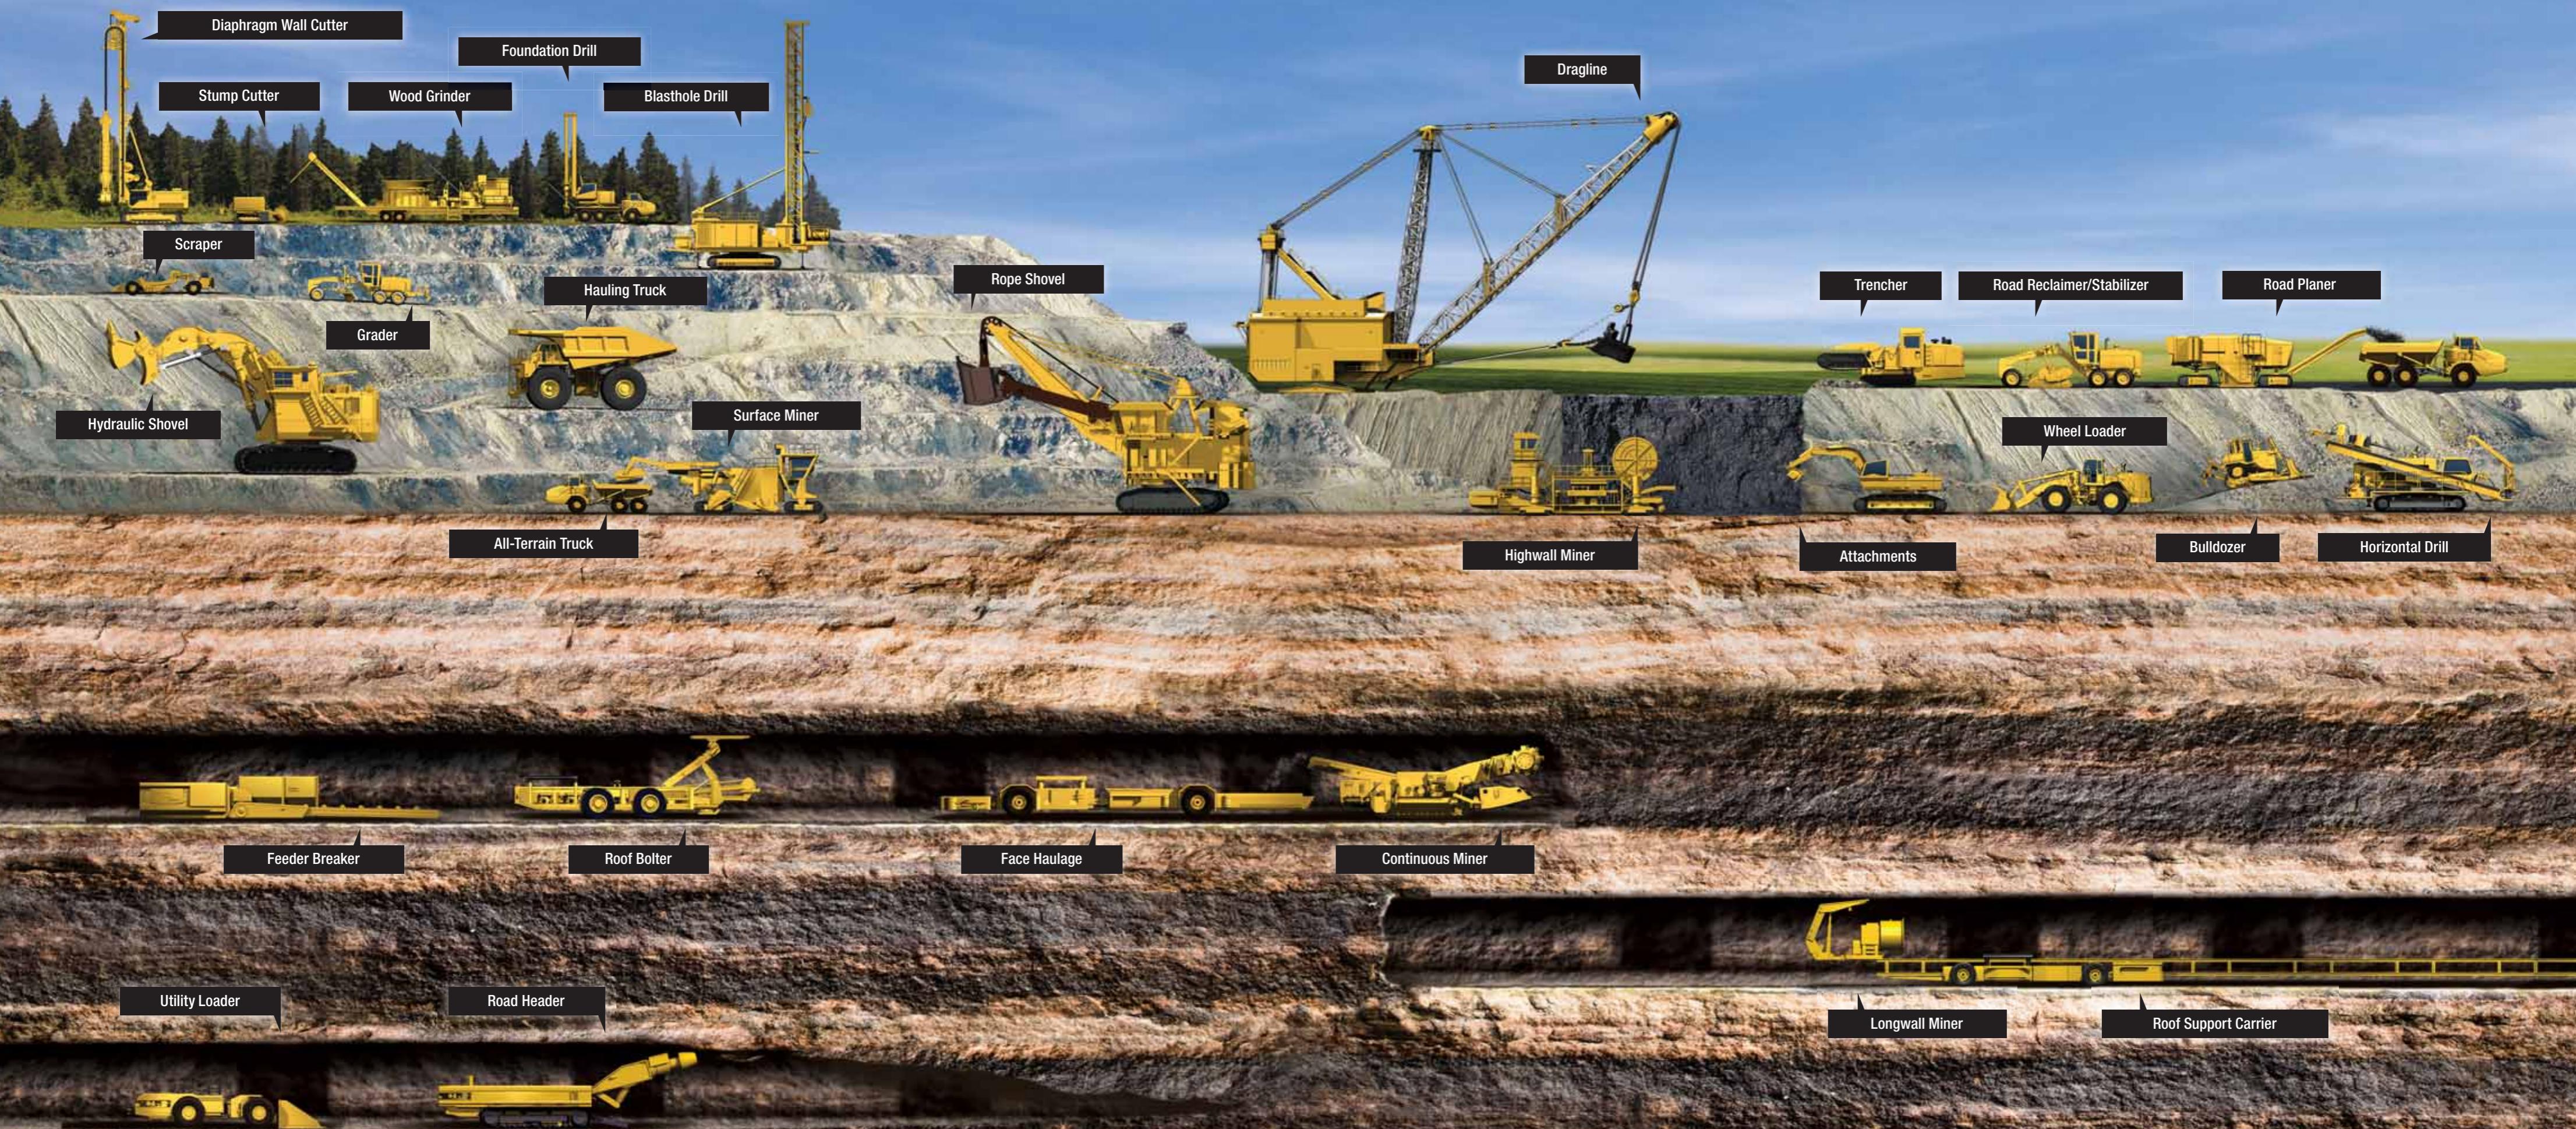

With leading-edge products from roadmilling and soil stabilization conicals to complete custom fabricated cutter drums, we keep high-value equipment running longer and performing better in demanding environments.

- Road Planer
- Road Reclaimer/Stabilizer
- Attachments
- Bulldozer

FOR THE MOST DEMANDING APPLICATIONS

Productivity Tips

Learn the most effective tips for tool selection, maintenance, and wear progression to increase productivity and ensure the highest return on investment.

Safety

Safely Installing and Removing Kennametal Tools

Follow all approved safety procedures. Wear all approved personal protective equipment, including safety goggles or a face shield.

To avoid personal injury or damage to the Kennametal tool, please follow the following instructions:

- To avoid breaking the carbide tip, use a soft hammer (copper), rubber mallet, or air hammer installation tool to install the tool.
- Make sure the tool is properly seated and securely retained before entering the cut. **DO NOT** strike the tool after it is properly seated in toolholder. This could damage the carbide tip or retaining system.
- Inspect the tools before each use. If the tools are dull, bent, cracked, burred, or showing signs of excessive steel wear, **DO NOT** use them and replace immediately.
- When removing the tools, exercise care in handling the tools as the tools may be hot after use.
- When removing the tools, use appropriate bit puller, hand punch, air hammer punch, or air hammer chisel to extract the tool from the toolholder.

Maintenance

What to Look for While Maintaining:

- **Tools**

A conical tool performs best when the steel body and carbide tip are worn out at the same time. If the tool shows signs of excessive steel wear, carbide wear, or fracturing, this will have a negative effect on your tool and machine performance and the tool should be replaced immediately.

- **Retainers/Sleeves**

A conical tool performs best with a combination of ridge support and freedom of rotation. Loose/worn sleeves and excess material build up on the tool will have a negative effect on the tool performance that could result in carbide flat spotting or fracturing.

- **Blocks**

Blocks are more stationary than retainers and are not easily replaced. Identify unusual wear on the sides and the bore of the block and replace if necessary.

- **Conveyor Belts**

Conveyor belt condition is very important. If the belt is worn out, the milled material will not be removed from the cutter box and will create a "Sand Blaster" with the abrasive, milled material prematurely wearing out the steel body of the tool.

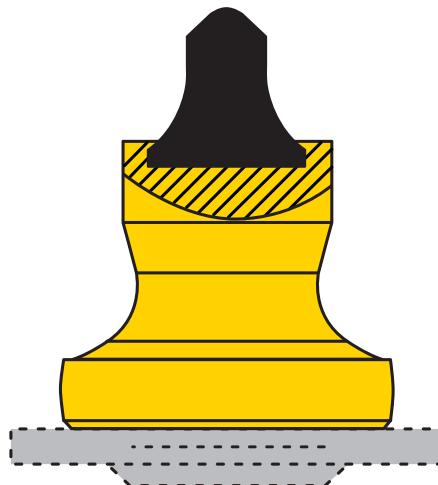

- **Track Pads**

Track pads push the milling machine and drum into the cut and if the track pads are worn and cannot create the force needed to push the milling machine and milling drum, this will have a negative effect on the entire cutting system (tools, sleeves, blocks, and milling drum) and machine performance.

Selecting the Right Tool

When selecting a tool, consider the material to be cut as well as the machine horsepower. If you want better strength, wear, or penetration:

- Increase the carbide tip base diameter for better strength and wear resistance.
- Decrease the carbide tip base diameter for better penetration.
- Increase the carbide tip diameter for better strength and wear resistance.
- Decrease the carbide tip diameter for better penetration.
- Increase the carbide tip length (height) for better penetration and wear resistance.
- Decrease the carbide tip length (height) for better strength.

Understand Wear Progression

By understanding proper tooling wear progression, you can maintain optimal throughput and performance. Continued use of tooling beyond its useful life cycle can have adverse affects, such as marginal productivity, catastrophic machine failure, or costly repairs. This proper wear progression can help you:

- Increase tool utilization.
- Avoid catastrophic failure.
- Maximize cutting performance.

Optimal Wear Progression

Troubleshooting

The three categories of tool failure: abrasive wear, heat failure, and mechanical failure, each contribute to less than optimal tool performance. Wear and deterioration can be observed through cracking, crater wear, chipping, deformation, or fracture.

The chart below shows typical end-of-life tool problems, possible causes, as well as proposed solutions.

Problem	Possible Cause	Solution
 Poor Rotation	Worn toolholders	Replace worn holders
	Excess material build-up on tool	Increase water flow to drum
	Holders not properly aligned	Remove incorrect holders and correct positioning
	Excessive machine speed	Slow down machine
	Cutting too deep	Decrease cutting depth (make 2 or more passes)
 Excessive Steel Body Wear	Caused by highly abrasive material	Consider using a tip design with bigger start diameter
	High rotation speed	Reduce rotation speed (if possible)
	Worn belts are not removing the material	Consider using a heavier body tool
		Check and replace worn belt
 Extreme Carbide Tip Wear	Hard material (aggregate)	Consider using a larger carbide tip tool
	Heat build-up on tool	Increase coolant (water) to the drum
	High rotation speed	Reduce rotation speed (if possible)
	Cutting too deep	Decrease cutting depth (make 2 or more passes)
 Tip Fractures	Extremely hard material (aggregate)	Consider using a larger carbide tip tool
	Heat build-up on tool	Increase coolant (water) to the drum
	Poor rotation	Check for worn holders, excess material build-up on tool, etc.
	Excessive machine speed	Consider doing a "warm-up" cut when starting
	Using hard objects for tool installation	Slow down machine
		Use air hammer installation tool, rubber mallet or copper hammer

Engineered Solutions

New or rebuilt drums that simply perform better and last longer to optimize your road milling productivity and profitability.

Milling and Reclamation Drum Program

- Block systems provide proven performance.
- End rings proven to reduce wear and provide straight cut.
- Optimum road patterns and matching capabilities.
- Balanced to reduce machine vibration.
- Drum designed to meet your application needs.

Drum Lacing Designs

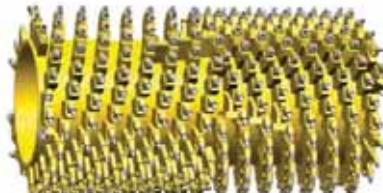

- Computer-engineered tuned drum designs with synchronized lacing.
- Provide options to view the road pattern at different speeds and RPMs before you purchase your drum.
- Software program creates and maps perfectly balanced drums.
- Ensures optimum placement of cutting tools.
- Provides maximum productivity and wear characteristics.

Specialty Drums

KenCast™

KenCast parts are unique because no one makes wear parts like Kennametal. These extremely durable wear-resistant parts are manufactured in our own foundry.

Your equipment runs in abrasive conditions. Protect your investment with Kennametal KenCast composite material. It combines the exceptional wear resistance of Kennametal cemented tungsten carbide with the toughness and practicality of air-hardened steel.

Use KenCast parts on:

Reclamation Equipment

- Pedestal protectors
- Side cleaner bars

Road Planing Equipment

- Kicker plates
- Drag shoes
- Quick-change block-base protectors

Trenching Equipment

- Base segment protection

KenCast Parts Are:

- Easier to apply and tougher than brazed-on solid carbide tiles.
- Longer lasting and easier to apply than hardfacing material.
- More wear resistant than standard or AR-type steels.
- Better at protecting the carbide particles than embedded weld overlays.

Environment

Kennametal's intimate understanding of the road construction marketplace — including customer processes and applications — allows us to proactively address production and sustainability concerns with solutions tailored to your needs. We deliver superior value because we listen closely to you, our customer, and innovate based on your feedback. Our goal is to help you be more competitive — both at home and on a global scale.

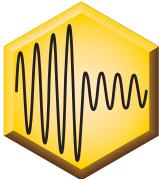

Best Practices in Productivity

As your trusted partner for optimized production, Kennametal offers customers a unique commitment to research and development excellence, continually delivering highly innovative ways to enhance productivity. Certification to ISO 9001, QS 9000 TES, and VDA 6.4 provides the highest possible quality standards.

Best Performance, Less Environmental impact

With technology, we can do both. Kennametal helps customers focus on the root causes of unsustainable behavior in highly complex manufacturing systems, while at the same time improving cost structure, quality, and performance.

RoadRazor ECO™ Pro

It is designed to work differently than any tool ever available in the industry. Its exclusive and sleek proprietary body shape, with maximum hardness throughout the entire head area, makes cutting easier and far less resistant to extreme wear and friction. It enables you to run **longer and faster** than ever thought possible...making it your **ECOnomically** superior choice.

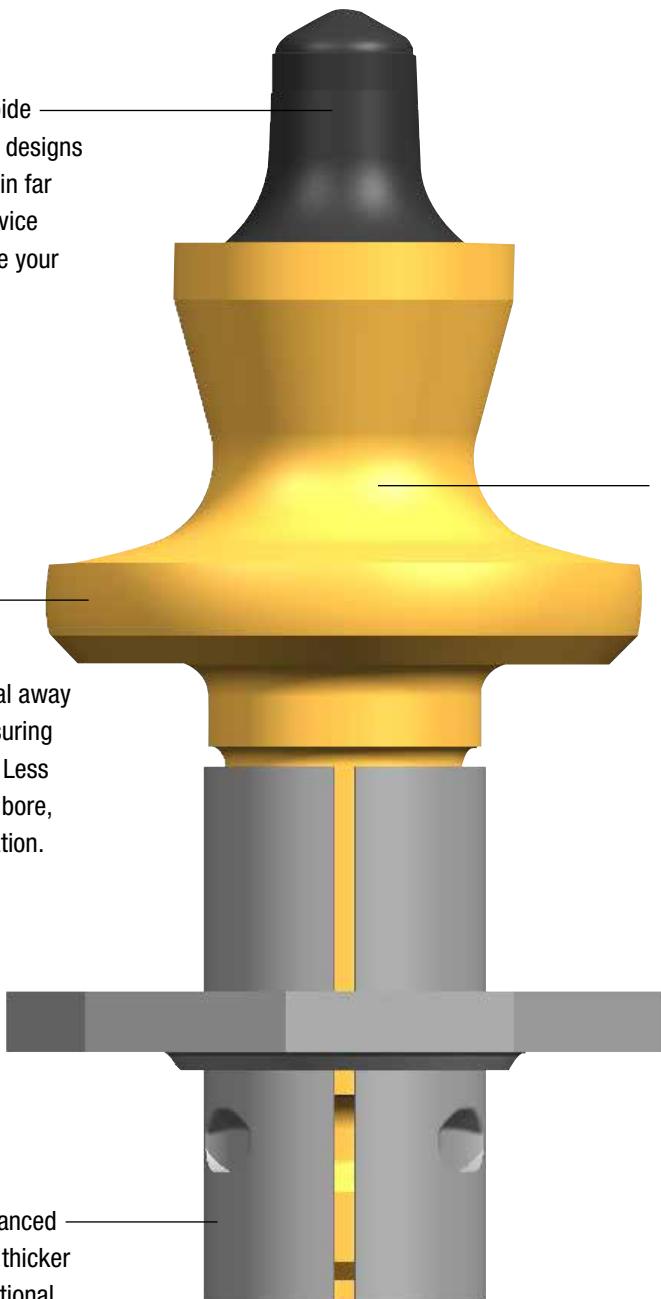

Its unique and proprietary nonagon shaped washer is 20% thicker, which extends the life of the tool and the holder, giving you the Pro advantage. The nonagon design with overhanging corners also makes cutting easier by encouraging tool rotation...making it once again your **ECOnomically** superior choice.

Because you can now get your work done faster, your machines absorb far less abuse and can consume **less fuel**...making it your **ECOlogical** tool, too.

The wide collar leads the cut material away from the tool and holder, ensuring maximum holder protection. Less fine material comes to the bore, improving tool rotation.

ECO Pro delivers:

- Lower operating costs.
- Reduced fuel consumption.
- Increased uptime and performance.
- Improved holder life.
- Improved rotation.

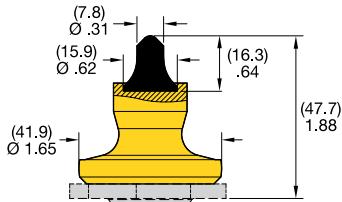

Now the industry's best carbide grades and proprietary point designs are even better — resulting in far less cracking and longer service life...no matter how abrasive your asphalt application.

Wide collar leads cut material away from the tool and holder, ensuring maximum holder protection. Less fine material comes into the bore, therefore improving tool rotation.

Our newly designed and enhanced retainers are now made of a thicker material that provides exceptional fit and rotation throughout the life of the tool.

Kennametal's unequalled and revolutionary shape — with maximum and consistent head hardness — yields unparalleled performance and service...so you can go faster, go longer, AND also have the option of using less horsepower (while still improving performance), thus reducing fuel consumption and machine emissions.

ACCESSORIES

ACCESSORIZE PRODUCTIVITY

Track Pads

- CUSHOTRAC™ Ultimate track pad — 2000-hour guarantee.
- Increased foot print, better traction, and less wear.
- Better cut, tear, and abrasion-resistant properties.

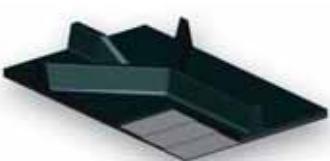

Conveyor Rollers

- Garland and flat return rollers.
- Extra long design reduces gaps between center and wing rolls, ensuring better belt tracking and maintenance.
- Lightweight, durable, and economical.

Power Belts

- Highly wear resistant.
- Multi-layered woven sheathing.
- For high-power transmission and impact load.

Conveyor Belts

- High abrasion resistance.
- High cleats for maximum capacity.
- Cleat and upper layer manufactured in one process step for maximum reliability.

Toolholders

Road Rehabilitation is what you do best. But the job can take you into challenging conditions.

Soil, asphalt, and concrete can be tough on cutting tool systems, so you need a toolholder that is equally tough.

If your current toolholders aren't making the cut and aren't keeping up with your expectations, see what Kennametal offers. It's what we do best.

KPF300 Series Systems • Offers up to 100% Improvement in Toolholder Life

KPF303R Toolholder

- Curved cross-section of retention surface and shorter extraction length for easier sleeve removal.
- Bore relief enables removal of asphalt build-up and broken shanks.
- Bi-directional easy-pull notches allow reversing sleeve to double the wear life in abrasive applications.

KPF303RX Toolholder

- All the benefits of KPF303R sleeve.
- Up to 20% increased wear life to meet your maintenance schedule.

KPF301 Base

- Heavy-duty base block for extended life.
- Large weld area for maximum strength.
- Relocator pins for positioning replacement blocks.

KPL302 and KPR302 Bases

- Compact, streamlined left and right bases.
- More conveyance capacity for deeper cuts.
- Effective conveyance for tighter line spacing applications.
- Engineered for unmatched durability.

Quick-Change Toolholder Systems

Assembly Instructions for QC100 Base and QC110HD Holder

NOTE: The system is held together by the taper. The following assembly process is critical. If the holder and base are not assembled properly, excessive movement between the two units will occur and the system may fail prematurely.

Step 1: Installing the Holder Before Welding

Choose Method A or B to assemble the quick-change holder and base prior to welding. To make sure the holder and base are positioned properly on the drum, use a cutting tool pointer in the holder.

Method A: Hammering

1. Place the quick-change holder in the base.
2. Lightly hammer the front of the holder "T" section to seat the holder into the base.
3. The front of the quick-change holder will protrude out from the base about 6,35mm (1/4").
4. The unit can be welded to a pedestal or drum.

Method B: Pressing

NOTE: Pressing the quick-change holder and QC100 base together is a more precise method of assembly.

1. Secure the base in a fixture that can safely apply 4.536 kg (10,000 lbs) of force.
2. Press the holder into the base with a load force of 4.536 kg (10,000 lbs).
3. With the holder pressed in the base, the unit can be welded to a pedestal or drum.

Step 2: Completing Assembly After Welding

For new drums and for in-field holder replacement:

1. Hit the holder on the front of the "T" section four to five times with a 1,8–2,3 kg (4–5 lbs) steel hammer. When hit, the pieces will start out making a dull "thud" sound. As they become properly seated, the sound becomes a high pitch "ringing".
2. At this point, the two pieces will be locked together with the tapers. The holder will still protrude out from the base.
3. Install the bolt supplied with the holder and torque to 27–32 kg (60–70 lbs) dry. **Do not attempt to seat the quick-change holders using the torque on the bolt only.** The bolt strength is insufficient to apply the required assembly load.
4. Operate the machine 4–6 hours. Check holders and bolts. Reseat any loose holders and re-torque any loose bolts.
5. After 10–12 hours of operation, check all holder assemblies again. All units should be tight at this check. If some units are found to be loose, disassemble and re-assemble.
6. Holder and base units that have been tightened twice are considered locked together on the tapers. Under normal working conditions, they should remain locked together. Bolts may become loose if taper tightens.

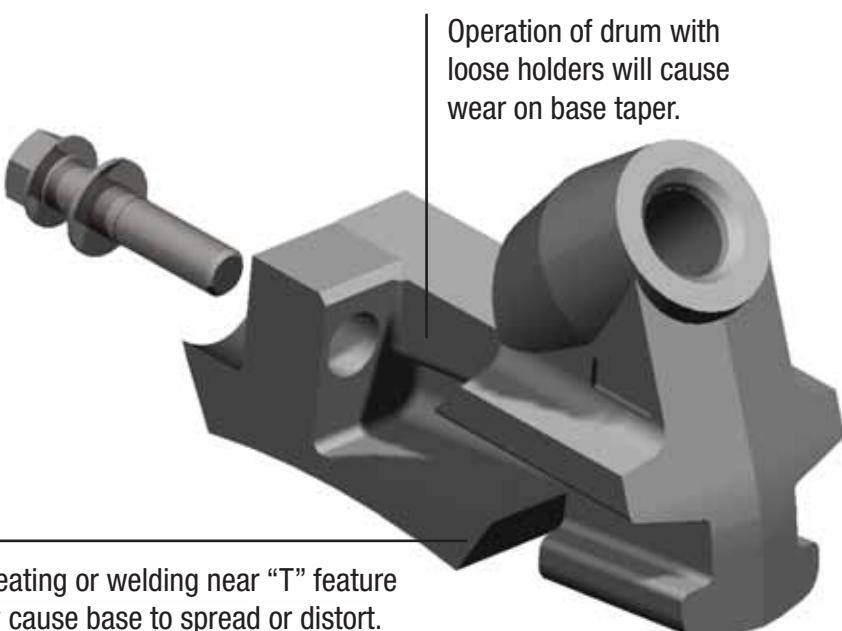

Quick-Change Toolholder Systems

Changing Worn Holders

1. Remove bolt. Hit the back of the holder as close as possible to the top of the base with a 1,8–2,3 kg (4–5 lbs) hammer. Be careful not to damage the base.
2. Clean any debris from the base. Install a new holder according to procedure in Step 2 (see page 67).

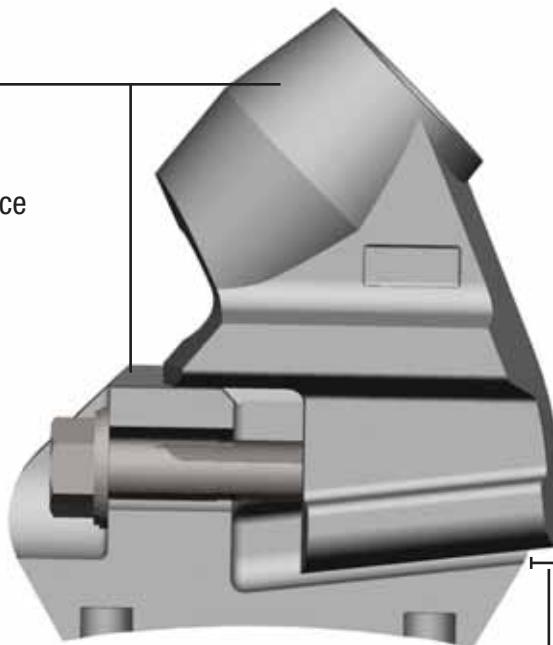

Use of Silicon Sealant (After Assembly)

Applying silicon sealant to the T-section of the holder may help to keep debris out of the seams between the holder and the base. To use sealant, apply it around the front seam after assembly of the holder into the base.

Additional Notes for QC110HD System:

Excessive heating or welding near "T" feature of base may cause base to spread or distort.

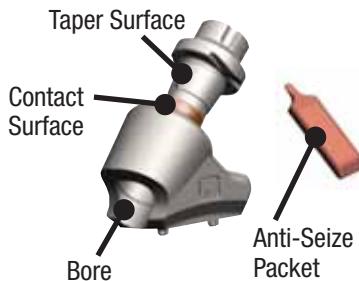

Holder and base are hardened steel for wear properties. Excessive force will cause fractures.

New base/holder should be 3,18–9,52mm (1/8–3/8") protrusion. If a new holder does not protrude, base is near the end of service life.

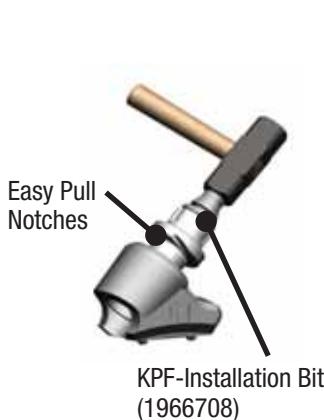

KPF300 Series Toolholder Systems

Assembly Instructions

Step 1: Sleeve Installation

- Use anti-seize or light oil to lubricate sleeve contact surface prior to installation (anti-seize packet included inside the bore of each sleeve).
- Do not lubricate the taper surface.
- Always clear debris from the base bore prior to installation.

Step 2: Sleeve Installation

- Easy Pull notches on the sleeve should be aligned with the opening towards the top of the block as illustrated above or rotated slightly for outside gage cutter blocks. This allows access for wedge puller during sleeve removal.
- Always protect the face of sleeve during installation — KPF installation bit (1966708) as shown above.
- Maintain proper alignment of sleeve with base bore when installing. If sleeve is misaligned it could damage internal bore of base.

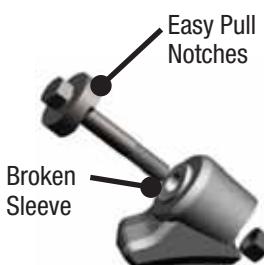

Step 3: Sleeve Removal

- Use the starter KPF301 SHP Wedge Puller (3395861), to break the taper on the sleeve (Fig. A).
- Use the KPF301 LGP Wedge Puller to move the sleeve the rest of the way out of the Base (Fig. B). If planning to re-install, be sure to clean bore and sleeve before installation procedure.

Step 4: X-Tractor Tool

This punch can provide another means to remove sleeves after breaking the taper lock with the KPF301 SHP Wedge Puller. This can only be used where accessible to rear of the sleeve.

KPF301 Sleeve Removal
Assembly (2273341)

Step 5: Broken Sleeve Removal

To remove a broken sleeve, first clear the bore of any material. This can be done with a 19mm (3/4") masonry bit and drill. Next, install the KPF301 sleeve removal assembly into bore of the sleeve and tighten nut as shown above. Then refer to normal removal with the KPF301 Puller shown in Step 3.

Carbide Tipped
Drill BitKPF301 Flex Drill
Assembly (2451454)

Step 6: Flex Drill Assembly

For cleaning bores of KPF303 sleeves when broken bit shanks are still in the bore. For other cleaning applications, use the drill from the front of the block without the flex assembly.

Features:

- 1/4" hex fits any standard drill.
- Flexible drill extension for hard to reach areas.
- Outer surface does not rotate.
- Carbide tipped drill bit gives high performance and long life.

NOTE: Lubricate flexible drive with two drops of machine oil in each end as needed.

U70 Padded Puller
(3043394)

Step 7: Tooth Removal (Manual)

Using the U70 padded puller and a hammer. Use puller to wedge between the tool and the sleeve to extract the tooth. Also can use RP puller, order code 1761401.

NOTE: Always use proper eye and face protection when extracting tools from sleeves.

KPF 300CH
(2427191)

Step 8: Tooth Removal (Air Hammer)

Using the KPF300CH Air Hammer chisel, start with the chisel between the tool and sleeve and wedge the tool out.

NOTE: Always use proper eye and face protection when extracting tools from sleeves.

Hydraulic Sleeve Removal Set

- Hand pump
- Hydraulic Cylinder
- Gage
- Extractor Washer (2458379)

Step 9: Hydraulic Sleeve Removal

- Hydraulically assisted removal.
- Flexible hose allows access to tight areas.
- Cylinder can move independently of pump.
- Light, portable design.
- 690 bars (10,000 psi) pump.
- Cylinder rated for 18.14 metric tons (20 tons) at 690 bars (10,000 psi).
- Removes sleeves more efficiently.
- Less physical strain to remove a sleeve.
- Safest way to remove sleeves.

Hydraulic Puller Rod and Sleeve Kit (2488006)

Puller Rod
(2485456)

Puller Shell
(2458377)

Step 10: Hydraulic Sleeve Removal

1. Clean toolholder bore.
2. Slide "c" end of puller shell between collar of toolholder and face of base.
3. Insert puller rod through extractor washer, hydraulic cylinder, puller shell and toolholder.
4. Thread puller rod nut fully onto end of rod.
5. Apply pressure to cylinder from pump.
6. If first stroke length of cylinder does not completely remove bushing, release pressure and add spacer between base face and puller shell.

INTRODUCING

The New Kennametal Innovations iPad® Application

Available as a **Free Download** from the iTunes® App StoreSM.

Now Available

The Kennametal Innovations iPad® app features interactive, cutting-edge animations and real-world demonstrations of Kennametal's productivity-enhancing technologies for machining and industrial processes. With selectable data, it is quick and convenient to compare complimenting and competitive products.

Easy to Download

Go to the iTunes® App StoreSM, and search for "Kennametal". Then follow the directions on downloading. It's simple, fast, and free.

Easy to Use

The simple navigation makes it easy to search via keywords to find specific tooling solutions and product groups. The user-driven navigation map offers drop-down menus with supplemental information, including expandable, and customizable, charts and graphs.

PERFORMANCE

PROVEN RELIABILITY. UNPARALLELED PRODUCTIVITY.

Underground or on the surface, the foundation for a successful mining operation is built on rock-steady forward progress. Kennametal, the world's leading tooling and services provider, is proud to offer SOLID, our solution-focused program that delivers new levels of performance and productivity.

Kennametal's Lean and Six Sigma trained professionals are working to design the safest, most productive solutions for the mining community. With a brainpower consisting of 85 PhDs and over 500 master's degrees, we have produced over 65 patents and have grown to manufacture products in 11 different locations around the world.

In addition to providing our customers with technical support and inventory despite the challenges of recession and boom, Kennametal is constantly evaluating and upgrading our products so you can continue to succeed — resulting in over 2,500 grades and 15 different steel platforms that deliver solid productivity under the most demanding conditions.

Track Pads

For more than 40 years, Superior Tire & Rubber Corporation has set the quality and durability standard for OEM and aftermarket rubber and polyurethane heavy-equipment components. All products come with a 100% work-life guarantee, including Superior's world-renowned CUSHOTRAC™ track pad line that has delivered the road-milling industry's absolute best protection against wear in even the most demanding operating conditions.

CUSHOTRAC Bolt-to-Shoe Ultimate Track Pad

Improved pad design provides longer life.

Polyurethane-style pad easily attaches to your grouser shoes and is backed by Superior's unique steel-on-steel contact technology that virtually eliminates loosening and vibration, major causes of premature wear. No need to buy new grouser shoes!

CUSHOTRAC Bolt-to-Shoe Track Pad

Polyurethane-style pad easily attaches to your grouser shoes and is backed by Superior's unique steel-on-steel contact technology that virtually eliminates loosening and vibration, major causes of premature wear. No need to buy new grouser shoes!

CUSHOTRAC Mold-On Track Pad

Adhere directly to your grouser shoes with Superior's proprietary mechanical steel-tab bond that facilitates maximum fit and performance, no matter how challenging the job.

Benefits of Power Pads

- ❶ Long life and best traction through balanced polyurethane composition.
- ❷ Due to special manufacturing process, no bondage failures.
- ❸ Highest load capabilities due to high-strength bolts and nuts; optimized bondage of the polyurethane with the bolts by gearing with the grouser profile.
- ❹ Form-locked join enables a perfect fit in the grouser, ensuring low forces on the bolt connection. No loosening of the nuts.
- ❺ No overhang at the sides ensures no peeling of the pads — even when cornering.
- ❻ No special tooling for installation needed. With the stud system, installation time can be greatly reduced. When changing worn pads, nuts can be easily loosened — even on the jobsite.

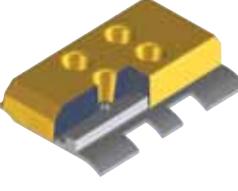

NOTE: This product is available for sale in EMEA only.

Garland and Flat Return Conveyor Rollers

Available for
virtually any
machine make!

- ➊ No rock buildup! That means no extra weight, no damaged belts.
- ➋ Lightweight assembly enables easier installation and handling!
- ➌ Outlasts competitive models!
- ➍ 25mm shafts with ultra-secure, long-life bearings held firmly in place by snap rings!
- ➎ 1" steel rings protect wing rolls from excessive wear when belt comes off track.
- ➏ Center segments made of super-tough, heavy-duty urethane-based material.
- ➐ Wing sections are constructed of solid polyethylene (UHMW-PE) for maximum abrasion resistance! In addition, heat buildup and belt damage are minimized.
- ➑ Five wear points prevent roller from being cut in half by "chevron" configuration of belt.
- ➒ Links actually thicker versus OEM offerings!
- ➓ Extra-long design reduces gaps between center and wing rolls, ensuring better belt tracking and maintenance!
- Durable
- Economical
- Lightweight
- Warranted

Garland Style

Flat Return Style

Conveyor Belts

- ❶ Transverse profile design.
- ❷ High cleats for maximum capacity.
- ❸ High abrasion resistance.
- ❹ High tensile strength for maximum lifetime.
- ❺ Cleat and upper layer manufactured in one process step for maximum reliability.

Power Belts

- ① Highly wear resistant, multi-layered woven sheathing.
- ② Fiber-reinforced CR-plate.
- ③ Polyester rope for high power transmission and impact load.
- ④ Multi-layered tear-resistant cover plate with woven fabric inlay.
- ⑤ Base made from flexible high performance CR-blend.

KenCast™

Road Rehabilitation takes your tooling equipment through rough conditions

KenCast parts are unique because no one makes wear parts like Kennametal. These extremely durable wear-resistant parts are manufactured in our own foundry.

Your equipment runs in abrasive conditions. Protect your investment with Kennametal KenCast composite material. It combines the exceptional wear resistance of Kennametal cemented tungsten carbide with the toughness and practicality of air-hardened steel.

Use KenCast parts on:

Reclamation Equipment

- Pedestal protectors
- Side cleaner bars

Road Planing Equipment

- Kicker plates
- Drag shoes
- Quick-change block-base protectors

Trenching Equipment

- Base segment protection

KenCast Parts Are:

- Easier to apply and tougher than brazed-on solid carbide tiles.
- Longer lasting and easier to apply than hardfacing material.
- More wear resistant than standard or AR-type steels.
- Better at protecting the carbide particles than embedded weld overlays.

Tri-Braze™

Impact- and Abrasion-Resistant Alloy Steel

Designed to tackle your toughest abrasion and impact applications, Tri-Braze combines a balance of alloying elements with controlled heat treating and extremely low sulfur for an ideal hardness/toughness ratio.

Tri-Braze is the standard by which all other impact- and abrasion-resistant alloy steels are measured.

Features and Benefits

- High hardness for better wear resistance (444 BHN).
- Balanced alloy steel chemistry for optimum hardness/toughness ratio.
- Extremely low sulfur content, fine-grain structure, and excellent internal cleanliness provides the highest impact resistance in the industry.
- Tri-Braze chemistry and processing ensures full hardness throughout the plate and avoids the soft middle of lesser quality plates.
- Long performance life and less downtime lowers overall maintenance costs.
- Tri-Braze chemistry provides excellent weldability in field conditions.
- Available in thicknesses up to 254mm (10"), widths up to 3048mm (120"), and lengths up to 7315mm (288").

Tri-Braze™ Dura-Plus™

The Next Generation of Abrasion-Resistant Alloy Steel

Tri-Braze Dura-Plus is the next step in the evolution of abrasion- and impact-resistant alloy steels. This proprietary technology provides a combination of hardness, toughness, formability, and weldability that is unavailable in any other wear plate.

Tri-Braze Dura-Plus is designed for extreme wear conditions. It is the perfect choice for liners, chutes, cutting edges, and blades in mining, quarrying, earth moving, manufacturing, and material handling applications.

Features and Benefits

- Average hardness exceeds 470 BHN.
- Longest performance life in the industry reduces downtime to lower overall maintenance costs.
- Tri-Braze Dura-Plus chemistry provides excellent weldability in field conditions.
- Balanced alloy steel chemistry for optimum hardness/toughness ratio.
- Extremely low sulfur content, fine-grain structure, and excellent internal cleanliness provides the highest impact resistance in the industry.
- Tri-Braze Dura-Plus chemistry and processing ensures full hardness throughout the plate and avoids the soft middle of lesser quality plates.
- Available in thicknesses up to 20mm (3/4"), widths up to 3048mm (120"), and lengths up to 5880mm (240").

Super-C™

Chromium Carbide Abrasion-Resistant Plate

Super-C is a chromium carbide overlay, wear-resistant plate with a mild steel base for weldability. The Kennametal Tricon™ unique cladding process produces a harder, tougher, and more wear-resistant surface, making Super-C superior to other chromium carbide plates.

Features and Benefits

- Mild steel base plate can be easily welded, bolted, or studded to existing structures.
- Can be applied to nickel-based, stainless, and other steel substrates.
- Ideal for severe-abrasion and moderate-impact applications.
- Maximum carbide concentration and alignment throughout the proprietary process.
- Consistent hardness and controlled chemistry.
- Excellent impact, abrasion, corrosion, and heat resistance.
- Proprietary herringbone pattern breaks up flow channels and premature plate wear, regardless of installation direction.

Prime Arc™ Welding Consumables

Prime Arc welding consumables are designed to provide our customers with the highest quality hard surfacing, build-up, and joining products available in the industry.

More than 35 years of welding and fabrication experience has enabled us to develop a unique product line that provides extended service life while reducing costly downtime.

Joining

Prime Arc joining electrodes and wires are formulated for field welding under the most difficult field conditions. We have a full line of electrodes and wires designed to join high-strength abrasion-resistant steel, manganese steel, and dissimilar metals.

Build-Up

Rebuilt parts often exceed OEM specifications for service life. Prime Arc build-up consumables are used for repairing and resurfacing expensive, worn parts.

Hard Surfacing

Whatever your wear problem, there is a Prime Arc wire designed for your needs. We have a full line of chromium carbide, complex carbide, tungsten carbide, manganese, martensitic, and tool steel consumables that can handle hard rock, earth moving, metal-to-metal, and other demanding applications.

Tubular

Our unique tubular hard-surfacing rods provide extremely high deposition rates and are available in a variety of chromium and tungsten carbide formulations.
