

BONDED PDX1™

PERSONAL PROTECTION AMMUNITION

The Winchester Bonded PDX1 is engineered to maximize terminal ballistics as defined by the demanding FBI test protocol, which simulates real-world threats—now available in a full line of popular handgun calibers.

- 1 Proprietary bonding process—Welds lead and jacket together to work as a unit controlling expansion and providing superior retained weight.
- 2 Upon impact—Bonding process ensures the lead permanently adheres to the jacket for maximum stopping power.
- 3 Hollow point—Works with the bonding process for outstanding performance through tough barriers.
- 4 Upon impact—Hollow point expands to 1.5 times the size of the original bullet diameter—maximizing the threat stopping power.
- 5 Copper alloy jacket—Contoured for maximum upset over a wide range of velocity/ranges.
- 6 Jacket notching—Six segments help promote positive, consistent and programmed expansion at a variety of impact velocities.
- 7 Upon impact—Notching has insured six concentric segments maximizing expanded diameter.
- 8 Nickel plated shellcase—Helps ensure positive gun function through smooth chambering and shellcase ejection.
