## Mil-dot Reticle <br> Technical Sheet

## NcSTAR

The Mil-dot Reticle is designed specifically to enhance a shooter's long range accuracy and ranging capabilities under a variety of field conditions.

A "Mil" is the abbreviation for Milliradian. A "Mil" is an angular measurement that is equal to $1 / 6400^{\text {th }}$ of a circle, which is equivalent to approx 1 Yard wide at 1,000 Yards distance. 1 MIL is equal to 3.6 inches at 100 Yards.

The Mil-dot reticle is divided into 5 Mil-dot increments (Picture: A).
Any known size target (height or width) can be ranged using a mathematical formula.

## TARGET size in Yards X 1,000 <br> Size of the Object in Mil

1 Yard is 36 inches (3 feet). Divide your Target's Size in inches by 36 inches to get your Target size in Yards.

The distance from the Center of a Dot to the Center of the next Dot is 1 Mil. The distance from the Center of a Dot to the middle of the line between Dots is $1 / 2$ Mil.

For Example: the silhouette target is 18 inches wide (Picture: B). The target's width is $11 / 2$ Mil using the scope's Mil-dot reticle over the target. Using the ranging formula above, we get the follow results:

TARGET'S width $\mathbf{= 1 8 "}$ inches wide $\mathbf{= 0 . 5 0 0}$ Yard $\frac{.500 \text { Yard X } 1,000}{11 / 2 \text { Mil }} \quad \frac{500}{1.5}=333$ Yards
