What’s New in CylanceOPTICS v2.4

CylanceOPTICS is an artificial-intelligence-powered endpoint detection and response (EDR) solution designed to extend the threat prevention delivered by CylancePROTECT® to identify and prevent the most challenging security incidents. CylanceOPTICS provides true artificial intelligence (AI) incident prevention, root cause analysis, smart threat hunting, and automated detection and response capabilities. The 2.4 release of the BlackBerry Cylance EDR solution offers several enhancements to the InstaQuery, FocusView, and Context Analysis Engine (CAE) logic of CylanceOPTICS to provide greater visibility capabilities.

These enhancement vectors include:
• Registry Introspection Enhancements
• DNS Visibility
• Windows Logon Event Visibility
• RFC 1918 Address Space Visibility
• Enhanced WMI Introspection Via Windows API
• Enhanced PowerShell Introspection Via Windows API

The 2.4 release of CylanceOPTICS brings several product enhancements to aid in both the breadth and depth of EDR search parameters. These enhancements, which are built on the foundational AI-based protection of CylancePROTECT and locally stored intelligence, offer real-time confidence to investigate, triage, and remediate when a CAE rule trigger occurs. This gives EDR practitioners the ability to search and remediate at the speed of the threat landscape, and not be delayed by cloud queries, protracted forensic analysis, and other time-wasting processes. The EDR team can understand all the artifacts that have occurred before and after the triggering event.

This results in:
• Increased search parameter flexibility within InstaQuery, FocusView, and CAE rules
• Faster incident response
• Alignment with the MITRE ATT&CK framework
• Expanded automated response via CAE rules

Identifying a potential security issue in any environment is important, however, to protect from the fallout of a widespread incident, organizations need the ability and agility to investigate and respond to an attack with speed and certainty. With CylanceOPTICS v2.4, organizations get several new product enhancements to accelerate incident investigation and response options that enable them to gather relevant information about an incident and act fast, either in an automated or customized manner, to meet their objectives.

What is CylanceOPTICS?

CylanceOPTICS is an endpoint detection and response (EDR) solution designed to extend the threat prevention delivered by CylancePROTECT by using AI to identify and prevent security incidents.

CylanceOPTICS provides:
• AI-driven incident prevention
• Automated threat detection and response
• On-demand root cause analysis
• Smart threat hunting
• Distributed search and collection
• Remote investigation capabilities
## Feature/Benefit Matrix

<table>
<thead>
<tr>
<th>Feature</th>
<th>Benefit</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Registry Introspection Enhancements:</strong></td>
<td>Provides increased visibility into common Windows Registry persistence points, including memory attacks via Focus View, InstaQuery, or CAE detection logic. This enhancement extends the visibility that CylanceOPTICS has into the Windows Registry.  The Windows Registry is commonly used by malicious actors to store malware settings, change system configurations, or establish persistence on a system. To more efficiently surface high fidelity, actionable information, CylanceOPTICS records registry keys and values that are commonly associated with malware or techniques of malicious actors. These enhancements can be used with Focus View, InstaQuery, or CAE. This is useful in monitoring for fileless attacks, lateral movement, living off the land attacks, etc.</td>
</tr>
<tr>
<td><strong>DNS Visibility:</strong></td>
<td>Enables the endpoint agent to sense and record what has instigated a DNS query, by which IP address and domain it was initiated, when it was initiated, and artifacts of the initiation via Focus View, InstaQuery, or CAE detection logic. This enhancement gives standard names to Internet connections (if available), providing visibility into DNS cache compromises, rogue DNS servers, DNS-based data exfiltration, and connections to web addresses rather than just IP addresses.</td>
</tr>
<tr>
<td><strong>Windows Logon Event Visibility:</strong></td>
<td>Enables the endpoint agent to sense and record what has instigated a Windows Logon event, the user that logged on, by which IP address and domain it was initiated, when it was initiated, and artifacts of the initiation via Focus View, InstaQuery, or CAE detection logic. This new feature enables monitoring of a specific user if they access multiple systems and is helpful in detecting and mitigating potential insider threats. Further, this provides visibility to observe where the attacker went and what he did when moving laterally through the network.</td>
</tr>
<tr>
<td><strong>Private Address (RFC 1918 / RFC 4193) Space Visibility:</strong></td>
<td>Enables the endpoint agent to sense, analyze, and record an event originating from a private Internet address on a TCP/IP network via Focus View, InstaQuery, or CAE detection logic. This feature is extremely valuable when looking for lateral movement attacks. Previous versions could only view movement through a public network space.</td>
</tr>
<tr>
<td><strong>Enhanced WMI Introspection:</strong></td>
<td>Enables the endpoint agent to sense, analyze, and record an MS Windows Management Instrumentation event via Focus View, InstaQuery, or CAE detection logic. This is useful in monitoring for fileless attacks and lateral movement, living off the land attacks, etc.</td>
</tr>
<tr>
<td><strong>Enhanced PowerShell Introspection:</strong></td>
<td>Enables the endpoint agent to sense, analyze, and record a PowerShell event via Focus View, InstaQuery, or CAE detection logic. This enhancement extends the visibility that CylanceOPTICS has into PowerShell events, which are commonly used to rapidly automate tasks that manage operating systems and processes.</td>
</tr>
